Bacteriol. 174:2582-2591(1992).

-!- FUNCTION: MEMBER OF THE TWO-COMPONENT REGULATORY SYSTEM VANS/VANR.

-!- FUNCTION: MEMBER OF THE TWO-COMPONENT REGULATORY SYSTEM VANS/VANR.

ACTIVATES THE TRANSCRIPTION OF VANH, VANA AND VANX IN RESPONSE TO VANCOMYCIN WHICH RESULTS IN VANCOMYCIN RESISTANCE. VANS ACTIVATES VANR BY PHOSPHORYLATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL).

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN (POTENTIAL).

-!- SIMILARITY: TO OTHER PROKARYOTIC SENSORY TRANSDUCTION HISTIDINE KINASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE; 92210502.

IT BINDS TO THE E2RE RESPONSE ELEMENT (5'-ACCUNUNUNGGT-3') PRESENT IN MULTIPLE COPIES IN THE REGULATION REGION. IT CAN EITHER ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION WITH REGARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA
                                                                                                                                                                                                                                                                                                                                                                        351

                                             "TAGI is a single out enzyme for HPV-18.";

Nucleic Acids Res. 21:1041-1041(1993).

-i- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

IT BINDS TO THE E2RE RESPONSE ELEMENT (5'- ACCHNININGGT-3') PRES

IN MULTIPLE COPIES IN THE REGULATORY REGION. IT CAN ETHER

ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION

WITH REGARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS

BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION

INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                VE2_HPV18

"IT BINDS TO THE EZRE RESPONSE ELEMENT (5'-ACCUNNNUNGGT-3') PRESENTIN MULTIPLE COPIES IN THE REGULATORY REGION. IT CAN EITHER ACTIVATE OR REPRESS IN THE REGULATION OF EZRE'S POSITION WITH REGREDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   351

-II- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

-II BLINDS TO THE E2RE RESPONSE ELEMENT (5'-ACCUNUNUNGGT-3') PRESENT IN MULTIPLE COPIES IN THE REGULATORY REGION. IT CAN EITHER ACCTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION WITH REGARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION INTITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE; 96194130.

-i- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

-i- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION AND DNA REPLICATION.

-i- FUNCTION: E2 REGULATES VIRAL TRANSCRIPTION IT CAN EITHER

IN MULTIPLE COPIES IN THE REGULATORY REGION. IT CAN EITHER

ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION

WITH REGARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS

BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION

INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA

INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA

WCKENNA R., BOWMAN B.R., IIAG L.L., ROSSMANN M.G., FANE B.A.,
"Atomic structure of the degraded procapsid particle of the
bacteriophage 64: induced structural changes in the presence of
calcium ions and functional implications.";
J. Mol. Biol. 256:736-750(1996).
I-FUNCTION: MAJOR SPIKE COMPONENT. INVOLVED IN THE ACTEACHMENT TO
THE BACTERIAL HOST.
I-SUBUNIT: THE VIRION IS COMPOSED OF 60 COPIES EACH OF THE F. G.
J PROTEINS, AND 12 COPIES OF THE H PROTEIN. THERE ARE 12 SPIKES
WHICH ARE EACH COMPOSED OF 5 G AND ONE H PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VGG_BPG4

HOLECULE WHICH AFFECTS THE DEVELOPMENT OF DISCRETE REGIONS OF
TISSUES. IS LIKELY TO SIGNAL OVER ONLY FEW CELL DIAMSTERS.
IS SUBCELLULAR LOCATION: POSSIBLY SECRETED AND ASSOCIATES WITH THE
EXTRACELLULAR MATRIX.
IS SUBCELLULAR STAGE: EXPRESSED DURING EMBRYOGENESIS.
SIMILARITY: BELONGS TO THE WAT FAMILY.
                                                                                                                                                               This SWISS-PROT entry is copyright. "DWnt-4, a novel Drosophila Wnt gene acts downstream of homeotic complex genes in the visceral mesoderm.";

Development 121:209-218(1995).

1- FUNCTION: ACTS DOWNSTREAM OF HOMEOTIC COMPLEX GENES IN THE VISCERAL MESODERM AND IS REQUIRED FOR EMBRYONIC SEGMENTATION.

-I- SUBCELLULAR LOCATION: SECRETED (PROBABLE).

"Prediction of the coding sequences of unidentified human genes. I.

The coding sequences of 40 new genes (KIAA0001-KIAA0040) deduced by

analysis of randomly sampled CDNA clones from human immature myeloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mycoplasma genitalium.
